CTS Network Design – Current

CTS's employees are all located under one roof, and all computer assets are linked to a single router.

Among the servers located inside the network are two public-facing web servers allowed access to via NAT. CTS hosts its own email, LDAP, database, and other general-purpose servers on the same network segment.

Current State assumes each server icon accounts for 2 servers and each workstation icon counts for 5 clients. CTS uses a Cloud Service for customers and for CTS internal use and backups
